

# Jump Squat King by ZiedYT

A program that serves as a "mod" for the game jumpking, that uses your cam inorder to play the game

## How To Use It

- Try to have no light sources behind you visible in the camera.
- Go to main/JumpSquatKing.exe and run it as administrator
- Use the drop down menu to select your camera. You may have to wait if you choose a camera with high resolution.

- 
- Use the eyes position for a better detection, make sure that you are close enough for your eyes to be visible. If enabled:
  - the program only accepts the faces where the eyes are visible, to remove false detections.
  - if no face got detected (eg slightly outside the camera, or not in frontfal view) the program uses the coordinates of the detected eyes if found.
- Use the flip checkBox to flip the input from the camera.
- Click the rotate button to rotate the camera.
- Set the pixel count you want to use. This represents the resolution of your camera.

- The higher the number, the better the tracking quality is and more computing power is needed.
- Use lower numbers if you encounter lag.
- Tracking boxes can be shown using the checkbox. There is 4 fields:
  - one that presses the right arrow(if you are in the left size even if you are squatting)
  - one that presses the left arrow (if you are in the left size even if you are squatting)
  - one that presses the spacebar (if you are squatting, even if you are in the left or right side, you don't have to be in the middle)
  - one that releases all the keys.
- You can change the size and position of the fields by changing the idle box position and size.
- When all your settings are ready, open jumpking, click start tracking inorder to start using the program.
- Also shout me out if you can, this makes me motivated to make open source stuff for everyone to use.
- If you encounter any bugs feel free to message me on twitter.
- If you are interested in the code, it's in the first folder.
